Common Person Equating. Some persons have taken both tests, preferably at least 5 spread out across the ability continuum. Step 1. From the separate analyses, crossplot the abilities of the common persons, with Test B on the y-axis and Test A on the x-axis. Test Equating, Scaling, and Linking (3rd ed.)

While there are many methods available to conduct equating, a commonly used approach for equating large-scale standardized tests—and the approach that is used for the MBE—is to embed a subset of previously administered items that serve as a “mini-test,” with the items chosen to represent as closely as possible the content and statistical characteristics of the overall examination.

VI. Linking and Equating: Getting from A to B Unleashing the full power of Rasch models means identifying, perhaps conceiving an important aspect, defining a useful construct, and calibrating a pool of relevant items that measure it over a meaningful range.

VI. Linking and Equating: Getting from A to B

In the Holland and Dorans (2006) framework, equating represents the endpoint of a continuum that begins with methods that make no assumptions about the relationship between the tests being linked (prediction and battery scaling) and proceeds to methods that are appropriate for linking tests that are very similar (concordances and equating).

General linear equating is a new approach to estimating a linear linking or equating function. The slope and intercept of the line are estimated based on multiple sources of information, including the means and standard deviations of X and Y, and other values supplied through μ_X and μ_Y , representing the centrality of X and Y, and σ_X and σ_Y , representing the scaling or variability of X and Y.
